Review of: "Evaluation of Ozonized Fibrin-Rich Plasma as a Therapy for Facial Rejuvenation: A Clinical Case Study"

Alessandro Crisci¹

1. Independent researcher

The number of patients is too small;

What types of tubes were used?

How many cc of blood were drawn each time?

What type of centrifuge was used (right-angle or oscillating);

Was the infiltration performed with a sterile needle (gauge?);

The images should be taken at higher magnification.

It would be best to distribute the administrations and photos as follows: 0th, 30th, 60th, and 120th day;

It would be helpful to calculate the cost of the procedure;
