The above paper is well written but it needs the following general points to be taken care of-

1. Check the grammar and at some places the sentence has to be started with a Capital letter. Like the last para in the Introduction.
2. In introduction, the last but one paragraph author states "other drugs cannot be used" what does he mean by this?
3. How many male Balb/C mice were used? Of what age? And how many mice were included per group?
4. The references for colorimetric analysis of oxidative parameters like SOD, CAT and OxG should be cited in the body text.
5. The inset in Figure 1 shows two Grp IV, what the authors want to indicate? The groups should be clearly defined.
6. What were the levels of these measured biochemical parameters in the Tubercular group?
7. In conclusion "The best dose was 10 mg/kg administered by i.g. route during 60 días", kindly check this line.
8. The paper is well discussed.
