Potential competing interests: No potential competing interests to declare.

The work reported by the authors is good. Bamboo was used for the production of biofuel. It will be a path to use other biomass to produce fuel. The experimental parts are written very clearly and are easy to understand. Following are some comments to improve the quality of the article.

- Can you specify which cost factors (e.g., raw materials, processing, labor) should be detailed in the cost estimation?
- Can you provide examples of similar studies and explain how the results of this study compare to those?
