

# Review of: "Strong Machine Learning: a Way Towards Human-Level Intelligence"

R. J. Arthi<sup>1</sup>

<sup>1</sup> Anna University

**Potential competing interests:** No potential competing interests to declare.

1. The paper looks like a survey of strong machine learning. It is not clear what they really want to implement in the field of their interest.
2. The author can have separate sections for introduction, literature review, and distinction between the existing and proposed models.
3. The author can avoid referring to self as I and WE.
4. The proposed method can be made more specific to a particular domain and can explain how the research has already been carried out earlier, how it can be improved by strong machine learning through inductive biases.
