INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Childhood disintegrative disorder. ORPHA:168782*

Childhood disintegrative disorder is a rare pervasive developmental disorder with a disease onset before the age of three and characterized by a dramatic loss of behavioral and developmental functioning after at least two years of normal development. Manifestations of the disease include loss of speech, incontinence, communication and social interaction problems, stereotypical autistic behaviors and dementia.
