In my opinion, the research experiment design of the author's paper is quite innovative, and various presuppositions and investigation objectives are reasonably designed. Here are some suggestions:

1. Do the initial family and educational background of the sample and the local education level have an impact on the result?
2. Is the sample of the survey representative of diversity within a certain region?
3. Among the samples introduced in detail, do they have the same educational difficulty? Or is the teaching difficulty consistent across different learning environments or schools?
