Congenital absence of both lower leg and foot

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Congenital absence of both lower leg and foot. ORPHA:294981*

Congenital absence of both lower leg and foot is a rare, non-syndromic, terminal transverse limb reduction defect characterized by unilateral or bilateral absence of both the tibia and the fibula, as well as the distal elements composing the foot.
