Potential competing interests: No potential competing interests to declare.

The article title rightly captures the intention of the Authors as well as the content. Generally a well written article. Some few observations:

Introduction: Some of the figures quoted for prevalence in Jasikan Municipal for 2019, 2020 and 2021 were not referenced

Methods: The continued use of the word census approach is confusing since only those with the interested characteristics were administered the questionnaire not all the population as would apply to Census approach. Purposive sampling is the appropriate term

Results: Calculation of the prevalence; the figure 73,263 is not referenced. I suppose is the population size. It should be stated under the study population

Discussion: It can be more robust considering many variables looked at in the result. The prevalence found could also be related to other studies in similar settings in other African countries. It would enrich the article.
