

Review of: "Enhancing Soil Stabilization in Soft Soils Through The Addition of Sand to Soil-Cement Piles: a Comprehensive Study"

Muluneh Bogale

Potential competing interests: No potential competing interests to declare.

Abstract section: It needs some clarification. Clearly describe the problem statement or the specific issue intended for study in your study area, and the specific approaches, including statistical procedures and software used.

Background: You need to put strong evidence on the limitations of other methods of soft soil stabilization beyond your study. Since the paper is original research, it must contain citations. There were no authors appropriately cited inside the body of the manuscript.

Methodology: Testing procedures, "testing on soil sample," contain unnecessary or misplaced paragraphs (paragraph 2, lines 1-3, and paragraphs 3 and 4). Better to put them in the appropriate section of the introduction part. Additionally, better to write about your study design, data collection methods, and methods of analyzing your data.

Results and discussion: No need for writing like "this table represents"; refer to table 3 in your manuscript. The results of your study need detailed explanation with the support of recent works. Very shallow discussion.

References: The list of references was very old; I did not see any recent works that support or oppose your work.
