Potential competing interests: No potential competing interests to declare.

The paper provides a comprehensive overview of Academic Information Systems and examines factors that influence their acceptance, including perceived usefulness, perceived ease of use, and user interface design.

Kindly consider some small suggestions to improve your paper:

Introduction: Consider providing a more concise definition of AIS in the introductory paragraph to ensure clarity and succinctness; Articulate the gap/problem that your study aims to address. What specific issues related to AIS acceptance or implementation are you trying to explore?

Literature review: Provide a more structured review of the literature by grouping related studies together based on themes or factors influencing AIS acceptance; Critically evaluate and synthesize the existing literature to identify gaps or inconsistencies that your study intends to address.

Research methods: Provide more detail on the sampling strategy, including the rationale for selecting students from the Health Polytechnic of Malang City as the study population; Describe the survey administration process in more detail, including how you ensured the anonymity and confidentiality of the responses; Provide more information about the Likert scale used in the questionnaire, including the range and the interpretation of responses.

Overall, the study is well addressed. However, attention to clarity, coherence, and depth in each section can further strengthen the solid contribution of the paper.
