The study, titled "Why Non-HDL Cholesterol is Preferred over Apolipoprotein B-100 (Apo B)" is an interesting study and the paper is generally well written and structured.

Title: give good indicator on authors work

Materials and methods: why did authors choose 140 Normal and 242 ASCD patients, all men, 40 to 70 years old ? why authors not included women? Must explain

Results: Table 1 needs a more precise legend. Apo B and Lipid parameters are preferably involved.

Final decision: good work and my recommendation is proceed with publishing
