Gordon Betts , cited on Wikipedia, gives the following definition of homeostasis: "In biology, homeostasis is the state of steady internal, physical, and chemical conditions maintained by living systems." (Gordon., Betts, J. *Anatomy and physiology*. DeSaix, Peter., Johnson, Eddie., Johnson, Jody E., Korol, Oksana., Kruse, Dean H., Poe, Brandon. Houston, Texas. p. 9. ISBN 9781947172043. OCLC 1001472383.). George E. Billmann delivers the following: "Homeostasis, as currently defined, is a self-regulating process by which biological systems maintain stability while adjusting to changing external conditions." (George E. Billmann, Homeostasis: The Underappreciated and Far Too Often Ignored Central Organizing Principle of Physiology. Front. Physiol., 10 March 2020, <https://doi.org/10.3389/fphys.2020.00200>). Both definition appear more comprehensive to me than the one provided by David F. Marks.
