this article related to research or not? if related to research, is there a research objective and research method used?

Are there samples and instruments used?

This research is interesting and good for research because it relates to female with ADHD in adolescence or adulthood, which currently there is still little research on, while phenomena in the field are currently more and more popping up that are diagnosed with ADHD... there are lots of ADHD in women who are misdiagnosed in childhood and only seen in adulthood so that the impact has been more due to being influenced by other factors and becoming problematic in marriage, work and further education relationships..

in this article many problems have been explained that arise related to the condition of ADHD, especially in interactions in the social environment and conditions neuropsychiatry... however, it needs to be more systematic and more focused in explaining each point so that the discussion is not too broad.... it needs to be clearer and focused on what is being discussed so that the discussion and conclusions will be more focused
