

Review of: "What is the impact of the COVID-19 pandemic epoch on IPD (Inpatient Department) hospital admissions in India? - A 41months comparative, quantitative, deductive Cross-Sectional Research Study"

Himanshu Raval

Potential competing interests: The author(s) declared that no potential competing interests exist.

Article is too long even including abstract. Length makes the article difficult to understand and makes it confusing at some point.

Abstract:

It is lengthy and needed to be structured.

Introduction:

Author can reduce content in background and should bring more clarity to aim and objective.

Methods & Materials:

there is no mention of surgical cases which were affected more.

Results and Discussion:

As during lockdown people were homebound, so reduction in communicable diseases was predictable. For NCDs, they were surely neglected during that period by patients themselves too. Data is represented very efficiently using charts and easy to understand.

Conclusions and recommendations

Based on study, it is proper and well oriented. What I believe as a doctor is that certain facts were not given importance and needed to be included in study. Recommendations, suggested are needed to be implicated to counter any health emergency.
