Potential competing interests: No potential competing interests to declare.

The study is sufficient in terms of theoretical and empirical analysis. One country is analysed. As much as explaining the relationship between exchange rates and interest rates and stocks contributes to the scientific literature, it is also important to explain the effect of oil prices on stocks for Nigeria, which is an important country in terms of oil.

The study is also sufficient in empirical terms. Necessary tests have been conducted. It is seen that sufficient explanations and suggestions are made in the conclusion section.
