Review of: "Simulating Lay Health-Seeking Behavior with LLM Personas and Illness Vignettes: Reproducibility, Prompt Sensitivity, and Slice Dependence"

幸子 大前[1]

1. Hiroshima University, Japan

This manuscript addresses an interesting topic and shows promise for further development.

The research objective is generally clear, though a bit more refinement could improve clarity.

Improving the structure and clarifying key terms would make it easier for readers to follow.

Adding some detail to the methodology would help readers better understand the study.

Further explanation of the data and analysis could strengthen the overall persuasiveness.

Positioning the work more clearly within existing literature would highlight its contribution.

The conclusions are meaningful, and including concrete examples could enhance their impact.

A brief discussion of practical applications would add further value to the paper.

Expanding the references would improve the academic robustness of the work.

Overall, the manuscript is thoughtfully prepared and could become even stronger with minor revisions.
