I would like to congratulate the authors on their fascinating work regarding this interesting manuscript on Thyroid Cancer. The manuscript is well-written.

I strongly recommend acceptance for publication of the paper after minor revision.

1) "The thyroid gland, consisting of two connected lobes, is one of the largest endocrine glands in the human body, weighing 20 - 30 g in adults. Thyroid lesions are often found on the gland, with a prevalence of 4%–7%. Most of them are asymptomatic, and thyroid hormone secretion is normal."

I would suggest adding this information in the introduction section and consider citing the recently published article:

<https://pubmed.ncbi.nlm.nih.gov/32965923/>

2) I would like a brief discussion on the Bethesda classification system for reporting thyroid cytopathology (especially for type II and III) and consider citing the recently published articles on Bethesda II and III:
