

# Review of: "Unlocking Natural Capital in the Megadiverse Colombian Pacific Basin: Navigating Challenges and Governance Gaps"

Fernando A. Rosete<sup>1</sup>

<sup>1</sup> Universidad Nacional Autónoma de México

Potential competing interests: No potential competing interests to declare.

The work presented is quite novel and relevant for Colombia, in addition to being a contribution to the calculation of the value of ecosystem services and natural capital.

The main weakness is the scale at which the work was carried out, since 1:1'000,000 is too coarse for the surface of the area analyzed.

Suggestions for improving the document are:

- Indicate in the body of the document the main types of biomes present (not the 80 mentioned, but the higher categories into which they are grouped).
- Indicate in the body of the document which ES are valued.
- It would be convenient to include in the results a summary table with the valuation of each ES by superior category of biome.

It is also advisable to check that all citations in the text are incorporated in the references, as there are some that are missing, such as Jiang et al., 2021.
