

Review of: "Knowledge, Practices and Attitude of Residents towards Buruli Ulcer in Jasikan Municipality: An Ethnographic Study"

Massimo Papi

Potential competing interests: No potential competing interests to declare.

The manuscript is an excellent ethnographic study about the awareness of a Ghana municipality on Buruli ulcer.

The themes which resulted are fundamental to understand the managing of this social plague. The method of in-depth interview has been correctly applied.

My concerns are the following:

1. Are the patients affected by Buruli ulcer 20 and 20 patients in the control group?
2. What was the clinical condition of the ulcer in the affected patients?
3. Was the diagnosis of BU obtained with a microbiological test or a PCR?

On the whole, the information resulting from the study is very good and allows the improve the social awareness of a chronic and highly disabling disease.
