Dear authors, excellent work with many tests to evaluate the toxicity of two extracts and the results of the study presented are highly relevant.

With much gratitude and respect I comment:

1. Excellent writing and structure.
2. Very well the consent and registration of the biosafety committee
3. Very good that they mention the labeling and authentication by a certified herbarium
4. It is suggested to mention how they chose the doses
5. It is suggested to include include $p = ***$ in the p values
6. This study is very valuable and would be enriched if organs such as kidney and liver of rats were analyzed by histological technique to identify cell damage due to toxicity

Congratulations best regards
