

Review of: "Optimized Low-Powered Wide Area Network within Internet of Things"

H. Parveen Sultana¹

¹ Vellore Institute of Technology

Potential competing interests: No potential competing interests to declare.

The paper may be rejected because the significance of the work is low.

Comments:

1. The research problem is not explained properly. An important aspect of the Introduction section is to pinpoint the research problem and to present the motivation for addressing it.
2. Literature review is not up to the mark. A literature review is presented from the perspective of how it resonates with the work that is presented in the paper.
3. In the methodology section, one must present their proposed work alone and in great explanatory length. If you wish to name your proposed methodology, it must start from here onwards. The framework must only include the input, processing, and output of your proposed method alone. Equation 3.2 seems incorrect too.
4. Results: Figures and tables should answer a question for a comparison between the proposed methodology and existing methods. Any other less significant information can be put into text in a line or two. No need to make a figure or a table unnecessarily.
5. No introductory materials anywhere but Introduction and concepts of common knowledge should not take up a lot of the space.
