

# Review of: "Impending role of hippocampal neurogenesis in the development of chronic epilepsy following seizures after Kainic acid and Pentyleneetetrazol treatment"

Lorena Roberta de Souza Mendes Kawamura

Potential competing interests: No potential competing interests to declare.

The study is very good. The information about the animals lacked data on sex (were they all males?), on how they were stored and fed. I think this part should have been better written.

The graphics, I believe, would be better with Bloxpot. Pay attention to the excess of information. I believe that using more monochromatic colors makes the images cleaner.

I thought the discussion was good. I missed using more studies to support the findings, especially in the first paragraphs. I believe that if this topic is improved, the work will become more elegant.
