The article "An Analysis of Pharmaceutical Inventory Management at a Leading Teaching and Referral Hospital in Kenya" is written properly mentioning the ethical aspects, need for the study, clear methodology and observations which have been discussed in comparison to other studies based on the same topic. The authors have also mentioned the outcomes in terms of future work to be planned in the hospital to tackle the areas of concern which came up in the observations like high consumption of flucloxacillin in view of the rising antimicrobial resistance, disconnect between disease cases and expenditure and procurement of medicines without consulting the latest KEML. Otherwise the pharmaceutical inventory management practices at the study hospital were found to be good.
