The subject matter of the theme is intriguing and promising. However, the article essentially comprises the description of a statistical experiment primarily based on questionnaires. There is a notable absence of an applied scenario and an appropriate scientific context supported by a robust literature review. This approach hinders the validation of the experiment itself and renders the conclusions null and void, as they are not comparable to any case study, nor is there a minimal definition of the starting methodology.

It is suggested to contextualize the experiment within a specific research domain, accompanied by a thorough literature review. Subsequently, introduce the scientific method that delimits the experiment, detailing the principles on which the questionnaire administered to the two groups of subjects is based.

At that point, the conclusions can be compared with relevant literature and case studies.
