I am sending my comments on the manuscript entitled: "Numerical Study of Thermal Performance on Fin and Tube Heat Exchanger with Flat Rectangular and Sinusoidal Winglet Vortex Generators". I have read the paper very carefully and found it an interesting piece of work that requires minor revisions prior to final consideration. I have some suggestions that may help to improve the paper's quality.

(1) The abstract is too general and does not align with the paper's core findings. I suggest the author(s) to focus more on their own findings (if any) to highlight the outcomes.

(2) I suggest highlighting the importance of the study or the research gap in the introduction section. Please clearly point out your contributions in the last paragraph of the Introduction.

(3) The current literature review is quite simple. It requires revision in a way that highlights the contribution of the current study.

(4) The results and discussion section seems OK. If possible, the results and discussion could be improved by referring to earlier results from the literature.

(5) The conclusion section needs attention towards the policy implications from the paper, which should be the core objective of the paper.
