This is often a challenging case in developing countries and TB endemic. The decision mostly same as this case report. But this case will add additional evidence on decision making. I have no suggestion regarding writing and text.

My suggestion will be on the clinical data that might be available and better be provided:

1. Evidence of hemolytic, the anemia itself might be cause by tuberculosis infection
2. Molecular testing (TB-NAAT/GenXpert MTB-Rif/else)
3. It was stated 2 episodes of another hemolytic, if this report provide longitudinal case report, it would be better.

Whenever the data not available, please provide more in discussion regarding some comments aforementioned.
