

Review of: "Emerging Omicron Subvariants EG.5 and BA.2.86: Implications for COVID-19 Immunity and Surveillance"

Luis Guevara

Potential competing interests: No potential competing interests to declare.

This article offers a good and understandable review of the emerging variants of the virus that causes COVID-19.

It is easy to read and will be of great help to undergraduate students of biomedical sciences and researchers in the specialty. Following the feedback from the reviewers, I would like to suggest the following:

- 1.- Include a simple and updated table of the variants of the viruses analyzed, including the original viruses, their variants, and the current ones. In this way, it would complement what was reported by the authors.
- 2.- There are some small details in the wording of the article (spaces between some words and some periods) that can be added to improve it.

Finally, I would like to thank you for the opportunity to review this interesting article which, added to the suggestions of other reviewers, will undoubtedly give great impact to the publication.

Thank you, and many successes.
