Thank you for this paper. The paper is so valuable to understand the impact of land use practice on the spatial variability of soil physicochemical properties.

Abstract:

In the title 'Properties' should be lower case.

Introduction:

In the last paragraph, you should write how your results can be used in different areas.

The main objective should be written clearly, you have written what you found. It is good to make suggestion for the future works.

Natural forest land part: **Please write Which kinds of trees the areas have?**

"Soil samples were taken from the three major land-use types (Natural forest, Plantation forest, and Agricultural land) from 60cm depth for investigating the effects of changes in land use on the Physico-chemical and biological characteristics of the soil. "

You said you used two different soil depths 0-30 and 30-60 why did you say just 60 cm depth here?

Conclusion

In conclusion, you have mentioned natural forests had better soil properties. This is an expected findings, maybe you can focus on why plantation and agricultural land had weak properties. You should also make again future suggestions in this part.
