Potential competing interests: No potential competing interests to declare.

The article aims to highlight the role of think tanks in the scientific debate on megatrends with an evolutionary approach. The authors identify seven think tanks in different countries of the world, which use different strategies to transfer scientific research on megatrends into politics. It is a very original and very interesting work because it stimulates reflection on the trends of globalization. This article fills a gap in the academic literature by analyzing the evolution of megatrends and future research. In the research, the idea emerges that sustainability passes, concretely, in an evolutionary comparison on mega trends in relation to strategies, economic development and sustainable development planning. The authors point out how the TTs are naturally connected to each other by the responsibility of ensuring the future sustainability of development policies which passes through the evolutionary analysis of the knowledge acquired through research. This is a work that evidently cannot have an important methodological significance. But in any case, I think the idea is more important than the method: sustainability passes through megatrends and how scientific knowledge translates into policies for the common good. A cultural dimension that seems forgotten in the scientific debate.
