# Review of: "Big Data, Granger Causality Analysis, and the Undecidability Property of Neuroimaging"

Konrad Biercewicz

**Potential competing interests:** The author(s) declared that no potential competing interests exist.

This paper addresses an interesting topic related to the basis of GC and its neural correlate, Granger-Geweke causality (GGC) analysis, based on statistics and information theory. However, the article contains a very large number of references to old literature. In addition to this, the article lacks a novelty-related element as well as the analyses themselves, which would enrich the article more. Nevertheless, the subject matter is interesting.
