DD-4A Regimen

National Cancer Institute

Source

National Cancer Institute. *DD-4A Regimen*. NCI Thesaurus. Code C67303.

A regimen consisting of vincristine, dactinomycin and doxorubicin, administered on a pulse-intensive dosing schedule, given in combination with radiation therapy following nephrectomy and used as a treatment for clear cell sarcoma of the kidney (CCSK) as well as advanced-stage Wilm's tumor with a favorable histology, including focal anaplastic disease.
