

Review of: "Curative Potential of Gbogbonise Epa Ijebu Herbal Remedy in Male Wistar Rats Infected with *Salmonella typhi*"

Zhao Kewei

Potential competing interests: No potential competing interests to declare.

The topic of alternative medicine has been a commonplace and this article focuses on *the Gbogbonise Epa Ijebu Herbal Remedy* which is innovative. First, since the herb is unfamiliar to readers, more detailed descriptions of *the Gbogbonise Epa Ijebu* are warranted in the introduction section. Second, the experimental design is logic and plain which involves appropriate sample capacity. But figures are lost and results are obscure. It's better to supplement relevant figures. Third, there are several language errors in the discussion section and the structure is unclear. More in-depth analyses and discussions about the curative mechanism of the herb should be added, which would give an exact direction to the next article. Fourth, the reference style is not matched that requires careful modification.

All in all, this article is innovative and attractive while some details should be taken into account.
