Potential competing interests: No potential competing interests to declare.

Doris Loh and Russel J. Reiter have summarized the role of melatonin and ATP in cataracts. The topic is fascinating and impressive, and the design is well done. However, I have two comments to improve the manuscript:

1. Could you please focus more on the signalling pathways that are involved in Crystallin Phase Separation?
2. Could you please add one more figure about the role of melatonin **in cataracts with details?**
