It is a new and interesting subject to review for me.

I think the following can be added for more clarification-

1. For easy understanding, an introduction regarding Sujok Tririgin therapy is needed.
2. The side effects and contraindications of this therapy should be mentioned.
3. In the case report, the patient's systemic illness, present or not, has to be mentioned. The chart was not so easily understandable, so how can the patient easily understand that? Please mention how the author made it easy for the patients.
4. In the discussion, please give examples. Whether this therapy has been applied in ophthalmology previously or it was a first-time effort.
5. Actually, it was only 2 case reports. Needs more cases for comments.
