Potential competing interests: No potential competing interests to declare.

The article effectively highlights the ethical crisis posed by climate change and its connection to various aspects of civilization. It skillfully examines the historical context of environmental warnings, tracing back to the Russell-Einstein manifesto and the Limits to Growth study. The discussion on civilization collapse, both in historical contexts and contemporary literature, adds depth to the analysis. However, the text occasionally meanders into tangential topics, such as the discussion on population policy and historical references, which could be streamlined for clarity. While the historical context is informative, more emphasis on current scientific findings and policy implications could enhance relevance. The exploration of ethical dimensions, including intergenerational equity and global inequity, is challenging. As improvements, I suggest the text focus more on key arguments and evidence, avoiding unnecessary digressions, which would increase clarity and impact. Providing more recent scientific data and examples to support assertions and enhance relevance is essential. Maintaining a balanced tone that acknowledges challenges while also highlighting opportunities for meaningful action would improve reader engagement.
