Although the topic of this article is very interesting, I find it extremely concise and it does not really provide new information nor does it contain an exhaustive review of the topic.

The author should delve deeper into each section. In fact, the bacterial strains are barely mentioned and their detoxification mechanisms are practically not explained. I think the author should include principles of bacterial remediation work. In this sense, I suggest the author include schemes on the role of bacteria in promoting plant growth, soil metal complexation, phytoremediation, as well as the bacterial mechanisms involved in soil bioremediation. This would also give the article more attractiveness and dynamism.
