

Review of: "An Improved Hybrid Transfer Learning-Based Deep Learning Model for Alzheimer's Disease Detection Using CT and MRI Scans"

Surendra Kumar Reddy Koduru

Potential competing interests: No potential competing interests to declare.

This study successfully categorizes Alzheimer's Disease patients into four phases: early mental decline, mild mental impairment, advanced mild mental impairment, and the final Alzheimer's stage. This categorization is achieved through transfer learning using various networks like ResNet50, VGG16, and DenseNet121, applied to a specially created extensive dataset.
