Potential competing interests: No potential competing interests to declare.

I would like to thank the authors for their work on the acute and subacute toxicity of Clematis hirsuta leaves and Rhamnus princides roots in an in vivo model. This work is interesting, but I have observed the presence of a few remarks.

- 1- Try writing plant names in italics and correct them by writing the correct botanical name for each plant.
- 2- in the abstract, delete this part « The data from the acute toxicity study was summarized as mean±standard deviation and analyzed using the unpaired Student's t-test. The data from the subacute toxicity study was summarized as mean \pm standard deviation and analyzed using Two Way ANOVA and Tukey's post hoc test. The significance level was set at $p \le 0.05$ » and add some values of the results you have obtained.
- 3- In the last part of the introduction, talk a little about your objective in this study and briefly cite your experimental method.
- 4- In section (2.5. Laboratory animals), add "Ethical considerations".
- 5- How you calculated the doses used in your work?
- 6- I think if you add a histopathological study, it will help evaluate your work.
- 7- Try developing your conclusion.
