Potential competing interests: No potential competing interests to declare.

The authors bring light to the research field of scientific dissemination, taking their work to the lay public through didactic transposition.

The article is written in a clear and objective manner, with a well-structured methodology.

Although I believe that the teaching method should not change, at least in the next generations — that is, the division of the different contents of physiology, anatomy, and other areas through functional systems — the intentionality of the work in disseminating content in an integrated way is commendable and should continue.
