Potential competing interests: No potential competing interests to declare.

The usual requirement for publication of a scientific article is that it contains some new research. The described methods are known. Comparing them for a given case would make sense if they were newly verified, preferably on newly obtained data. To compare the results, it is advisable to attach a table with numerical data. The benefit is usually declared by comparing previously used methods with newly proposed ones. New methods (or newly used in a given field) must have a measurable benefit or bring some new quality or opportunity.

The given topic is worth a much more detailed treatment, especially on real data. After that, you can submit it again.
