The topic is very relevant in the field of patents. Many other scholars have tried to improve this critical aspect of patent data management. I suggest adding a literature review of how other authors have addressed this issue. Furthermore, little has been explored in terms of experiments in the methodology. What is the validity of your results? Have they been tested? The methodological approach is convincing but needs to be tested with results. Moreover, the results achieved should be compared with other studies that have tried to reduce the problem of false positives.
