Potential competing interests: No potential competing interests to declare.

This article reported on comparison of Vegetation Community Diversity, Biomass, and Sediment Properties among Constructed and Reference Salt Marshes at Deer Island, Mississippi, U.S.A. I have some specific comments below:

Abstract: It Includes a lot of introductory information, and the methodology is unclear. In addition, the author claims significant and non-significant without mentioning the p-value or any other statistical value. I suggest putting those in the abstract, too.

Introduction: Too many objectives in the introduction section, and most of the citations are old. Please add the latest information/cite the latest published information. Also, ensure the author investigated all the objectives mentioned properly.

Overall, it has novelty and will be beneficial for researchers and academicians.
