Thank you for the opportunity to read and review this interesting article.

The theme is very important and contemporary, as gaining knowledge and skills in the field of mathematics is crucial in today's world. The theoretical analysis is well-developed and presented in a structured and logical way. There are a number of relevant citations, which help to develop further understanding on the subject and to outline the most important issues and theories. The methodology is revealed in a particular and detailed manner. The study is one of the few on this matter, which, on its own, is a good contribution to pedagogical science and practice.

I do have a few recommendations:

- If you add a few words about the software that you used to analyze the results the methodology will be more clear;
- It is good to expand a little bit more on the analysis of the results and to add more of your own conclusions;
- Consider mentioning the Continuing Professional Development of teachers and if it would have made a difference; if it should be mandatory in the mentioned countries.
