Potential competing interests: No potential competing interests to declare.

From a modeling point of view, the paper is comprehensive and thorough to include most of the relevant factors that influence energy consumption of an EV, although no novelty is added in terms of modeling, the work is still useful and makes chronological sense. The data graphics are insightful and helps the reader understand the typical ranges and values that a certain parameter might have. If the authors could update the sharpness and clarity of diagrams such as the Matlab/Simulink diagrams, it is very small as extremely hard to read.
