Review of: "Antibacterial Activity of Malaysian *Trigona itama* and *Trigona thoracica* Honey Against Gram-Negative and Gram-Positive Bacteria"

Vagner de Alencar Arnaut de TOLEDO¹

1. Universidade Estadual de Maringá, Brazil

Greetings,

Congratulations on the paper. It is an interesting area for research. However, to improve the study, it is essential to revise the statistical analysis, as the current approach compromises the reliability of the results. A comparative analysis between honey samples and their concentrations, as well as the correlation with the geographical origin of the samples, could provide valuable insights. Increasing the number of honey samples and incorporating replicates would enhance the scientific rigor of the research. Additionally, some references cited in the text do not adhere to the required standards.
