Potential competing interests: No potential competing interests to declare.

The topic is interesting but there are several aspects that should be further addressed and explained. Some observations are given below.

The abstract should be completed with some results of the study.

Some keywords are not necessary.

In general, more literature reviews required; for example a literature review should be included in the introduction

The figures and the language are ill-suited for a scientific publication

The methodological approach should be clearly defined; a part of the Results should be moved to the Methods

It would be helpful to specify what is meant by multiscale approach (macro, meso, and micro scales).

No data is given on the extent of mangroves

No information is given in the article about the nature and extent of the areas drained by the 3 rivers

A brief discussion of the relationship between sedimentation and mangrove growth in the study area could be added
