

Review of: "Interpreting the loss functions of Artificial neural networks in cancer research"

Mohammad Edalatifar

Potential competing interests: No potential competing interests to declare.

The loss functions discussed in this article are not specific to neural networks used in the field of cancer and have general applications. Based on the title, the reader expects specific aspects of the impact of loss functions on artificial intelligence networks in the field of cancer to be addressed, while this article only presents an overview of the use of three cost functions. It was expected that the article would prove the stated content using different tests on cancer datasets or at least use the results of other articles to support the presented material. The lack of presenting the formula for the loss functions, not examining details, and only examining three cost functions are other issues that should have been addressed in this article.
