The authors present an interesting article on Pallet loading Problem, However there are some corrections and should be addressed to improve the quality of the manuscript:

- The authors should explain the most important components of the proposed method in the abstract. Also quantitative achievements should be presented in the abstract.
- It is necessary for the authors to clearly state research contribution and achievements as bullet points at the end of the Introduction section.
- The authors need to present the complexity of their proposed method and compare it with some other state-of-the-art or successful classic methods.
- The authors don't discuss the limitations of the study correctly.
- The literature review is not concluded at the end! The related works, especially the works published in recent years, have not been well reviewed and compared, and the conclusions about the existing research gaps have not been presented.
- In the text of the article, especially in a review of related works, refer to the reference related to optimization. Refer specifically to this reference: [TC3PoP: a time-cost compromised workflow scheduling heuristic customized for cloud environments](#)
- Some typos should be double check.
- The author should explain more why solution quality of their proposed approach is much better than the others?
- Authors need to explain about the accuracy, sufficiency and reliability of their results? How do they verify and validate the results?
