Potential competing interests: No potential competing interests to declare.

- i. The text exhibited clarity, readability, and comprehensibility. There were links between the paragraphs and the statements as well. The manuscript had a good structure.
- ii. The literature review was current because recent papers were reviewed; however, the literature review was scanty as all of the reviewed papers were not up to 12 despite the fact that there are multiple articles regarding the title available.
- iii. Adebayo (2021) was not referenced.
- iv. Although the author discussed the relationships between the factors, such as how exchange rates and interest rates affect stock prices, these explanations were not founded on theory, implying that the explanation was based on the author's point of view.
- v. The control variable was inconsistent, as it was stated that "inflation and oil price were included as control variables." This sentence was eventually altered to "inflation and money supply are added for control purposes" (see page 6 under methodology, paragraphs 1 and 2).
- vi. Furthermore, in paragraph 2, dependent was referred to as (exogenous), when it should have been (endogenous).
- vii. Additionally, although the data were analyzed, the expected discussion of the results was absent. I believe a section on the discussion of findings should be presented separately to provide insight into the research's economic intuition.
- viii. Overall, the manuscript was well written, and I recommend its acceptance for publication by the editor.
