This topic is an important topic in public health field, to find out health issue by comparing urban and rural areas.

However, there are some relevant issues to publish as a scientific paper.

1) If this is a Review paper, there should be appropriate references in the Intro and Discussion sections. It would be good if the intro and discussion is based on previous research.

2) It is better to show the detail of methodology. Reader can't understand whether the paper is a secondary data analysis or just a review??

3) For tables, it is recommended that the digits are aligned. Even if this data table is calculated only mean, and the N, SD or SE etc is clearly stated according to methodology..

Also, as the Finding section mentions changes from 2013 to 2017, however there is no table for that. It should be show the those changes in additional table.
